EVALUATION SUBJECT:

**ENERTITE® NM, ENERTITE® G AND ENERTITE® IB-418
OPEN-CELL SPRAY POLYURETHANE FOAM
INSULATIONS**

1.0 EVALUATION SCOPE

Compliance with the following codes:

- 2015, 2012 and 2009 *International Building Code*® (IBC)
- 2015, 2012 and 2009 *International Residential Code*® (IRC)
- 2015, 2012 and 2009 *International Energy Conservation Code*® (IECC)
- Other Codes (see Section 8.0)

Properties evaluated:

- Surface-burning characteristics
- Physical properties
- Thermal resistance (*R*-values)
- Attic and crawl space installation
- Exterior walls of Types 1 through IV construction
- Air permeability

2.0 USES

2.1 ENERTITE® NM:

ENERTITE® NM is a spray-applied foam plastic insulation used as a nonstructural thermal insulating material in buildings of Type V construction under the IBC and dwellings under the IRC. The insulation may also be used on exterior walls of buildings of Types I, II, III and IV construction when installed in accordance with Section 4.5 Under the IRC and 2015 IBC, the insulation may be used

as air-impermeable insulation when installed in accordance with Section 3.4. The insulation is for use in wall cavities and floor/ceiling assemblies, and in attic and crawl space installations as described in Section 4.4.

2.2 ENERTITE® G:

ENERTITE® G is a spray-applied foam plastic insulation used as a nonstructural thermal insulating material in buildings of Type V construction under the IBC and dwellings under the IRC. The insulation may also be used on exterior walls of buildings of Types I, II, III and IV construction when installed in accordance with Section 4.5 Under the IRC and 2015 IBC, the insulation may be used as air-impermeable insulation when installed in accordance with Section 3.4. The insulation is for use in wall cavities and floor/ceiling assemblies, and in attic and crawl space installations as described in Section 4.4.

2.3 ENERTITE® IB-418:

ENERTITE® IB-418 is a spray-applied foam plastic insulation used as a nonstructural thermal insulating material in buildings of Type V construction under the IBC and dwellings under the IRC. The insulation may also be used on exterior walls of buildings of Types I, II, III and IV construction when installed in accordance with Section 4.5. Under the IRC and 2015 IBC, the insulation may be used as air-impermeable insulation when installed in accordance with Section 3.4. The insulation is for use in wall cavities and floor/ceiling assemblies, and in attic and crawl space installations as described in Section 4.4. ENERTITE® IB-418 is intended for use as thermal insulation and covering for ENERTITE® NM in attics and crawl spaces without the use of a prescriptive ignition barrier when installed as described in Section 4.4.2.

3.0 DESCRIPTION

3.1 General:

ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 are two-component, low-density, open-cell, water-blown polyurethane foam plastic insulation systems. The installed nominal density of ENERTITE® NM is 0.67 pcf (10.7 kg/m³). The installed nominal density of ENERTITE® G is 0.6 pcf (9.6 kg/m³). The installed nominal density of ENERTITE® IB-418 is 0.6 pcf (9.6 kg/m³). The two components of the insulation are polymeric isocyanate (A-component) and a resin (B-component) which when stored in unopened containers at a temperature between 50°F and 80°F (10°C and 26.7°C), have a shelf life of six months, nine months and twelve months, respectively.

3.2 Surface-Burning Characteristics:

3.2.1 ENERTITE® NM: When tested in accordance with ASTM E84 (UL 723), at a maximum thickness of 4.2 inches (107 mm) and a nominal density of 0.8 pcf, ENERTITE® NM has a flame-spread index of 25 or less and a smoke-developed index of 450 or less. There is no thickness limitation on the insulation when installed behind a code-prescribed 15-minute thermal barrier.

3.2.2 ENERTITE® G: When tested in accordance with ASTM E84 (UL 723), at a maximum thickness of 4.2 inches (107 mm) and a nominal density of 0.6 pcf, ENERTITE® G has a flame-spread index of 25 or less and a smoke-developed index of 450 or less. There is no thickness limitation on the insulation when installed behind a code-prescribed 15-minute thermal barrier.

3.2.3 ENERTITE® IB-418: When tested in accordance with ASTM E84 (UL 723), at a maximum thickness of 3.6 inches (91 mm) and a nominal density of 0.6 pcf (15.7 kg/m³), ENERTITE® IB-418 has a flame-spread index of 25 or less and a smoke-developed index of 450 or less. There is no thickness limitation on the insulation when installed behind a code-prescribed 15-minute thermal barrier.

3.3 Thermal Resistance:

ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 have thermal resistance (*R*-values) at a mean temperature of 75°F (24°C) as shown in Table 1.

3.4 Air Permeability:

3.4.1 ENERTITE® NM: ENERTITE® NM spray-applied polyurethane foam insulation, at a minimum thickness of 3.5 inches (89 mm), is considered air-impermeable insulation in accordance with 2015 and 2012 IRC Section R806.5 (2009 IRC Section R806.4) and 2015 IBC Section 1203.3, based on testing in accordance with ASTM E283 and ASTM E2178.

3.4.2 ENERTITE® G: ENERTITE® G spray-applied polyurethane foam insulation, at a minimum thickness of 3.5 inches (89 mm), is considered air-impermeable insulation in accordance with 2015 and 2012 IRC Section R806.5 (2009 IRC Section R806.4) and 2015 IBC Section 1203.3, based on testing in accordance with ASTM E283 and ASTM E2178.

3.4.3 ENERTITE® IB-418: ENERTITE® IB-418 is considered air-impermeable insulation in accordance with 2015 and 2012 IRC Section R806.5 (2009 IRC Section R806.4) and 2015 IBC Section 1203.3, at a thickness of 3.0 inches (76 mm) based on testing in accordance with ASTM E283 and at 3.5 inches based on testing in accordance with ASTM E2178.

3.5 Intumescent Coatings:

3.5.1 No-Burn® Plus XD: No Burn® Plus XD intumescent coating is a latex-based coating manufactured by No-Burn, Inc., and is supplied in 1-gallon (4 L) and 5-gallon (19 L) pails and 55-gallon (208 L) drums. The coating material has a shelf life of 36 months when stored in factory-sealed containers at temperatures between 40°F (4.4°C) and 90°F (32.2°C).

3.5.2 SPRAYCOAT™ 1920 Intumescent Coating: SPRAYCOAT™ 1920 intumescent coating, supplied by BASF Corporation, is a single-component, water-based, liquid-applied, intumescent coating. The coating is supplied in 5-gallon (18.8 L) pails and 55-gallon (208 L) drums and has a shelf life of six months when stored in factory-sealed containers at temperatures between 45°F (7.2°C) and 75°F (23.9°C).

3.5.3 DC 315 Coating: DC 315 Coating ([ESR-3702](#)), manufactured by International Fireproof Technology Inc. / Paint to Protect Inc., is a single-component, water-based, liquid-applied intumescent coating. The coating is supplied in 5-gallon (19 L) pails and 55-gallon (208 L) drums and has a shelf life of one year when stored in factory-sealed containers at temperatures between 50°F (10°C) and 80°F (27°C).

3.5.4 TPR² CORPORATION FIRESHELL® (IB-4) Coating: TPR² FIRESHELL® (IB-4) intumescent coating is a proprietary, water-based, one-part, nonflammable coating manufactured by TPR² Corporation. The coating is supplied in 5-gallon (19 L) pails and 55-gallon (208 L) drums and has a shelf life of 12 months when stored in factory-sealed containers at temperatures between 45°F (7.2°C) and 75°F (24°C).

3.5.5 TPR² CORPORATION FIRESHELL® F10E: TPR² CORPORATION FIRESHELL® F10E ([ESR-3997](#)) intumescent coating is a proprietary, water-based, one-part, nonflammable coating manufactured by TPR² Corporation. The coating is supplied in 5-gallon (19 L) pails and 55-gallon (208 L) drums and has a shelf life of 12 months when stored in factory-sealed containers at temperatures between 45°F (7.2°C) and 95°F (35°C).

4.0 INSTALLATION

4.1 General:

ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 must be installed in accordance with the manufacturer's published installation instructions and this report. The manufacturer's installation instructions and this report must be strictly adhered to, and a copy of the instructions and this evaluation report must be available on the jobsite at all times during installation.

4.2 Application:

The insulations must be applied using spray equipment specified by BASF Corporation. The product must not be used in areas which have a maximum service temperature greater than that specified in the manufacturer's published installation instructions, nor in electrical outlet or junction boxes or in contact with rain or water. The product must be protected from the weather during and after application. The insulations can be installed in multiple passes at 1/2 to 6 inches (12.7 mm to 152 mm) per pass to the maximum thickness. Where multiple passes are required, the cure time between passes is minimum 5 minutes for a 2-inch (51 mm) pass.

4.3 Thermal Barrier:

4.3.1 Application with a Prescriptive Thermal Barrier: ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 must be separated from the interior of the building by an approved thermal barrier, such as 1/2-inch (12.7 mm) gypsum wallboard installed using mechanical fasteners in accordance with the applicable code, or an equivalent 15-minute thermal barrier complying with the applicable code. There is no thickness limitation on the insulation when installed behind a code-prescribed 15-minute thermal barrier. When installation is within an attic or crawl space, as described in Section 4.4, a thermal barrier is not required between the foam plastic and the attic or crawl space, but is required between the foam plastic and the interior of the building.

4.3.2 Application without a Prescriptive Thermal Barrier: ENERTITE® NM or ENERTITE® G may be installed without the 15-minute thermal barrier prescribed in the IBC Section 2603.4 and IRC Section R316.4 when the installation complies with one of the assemblies described in Table 2

4.4 Ignition Barrier – Attics and Crawl Spaces:

4.4.1 Application with a Prescriptive Ignition Barrier: When ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 insulations are installed within attics or crawl spaces, where entry is made only for service of utilities, an ignition barrier must be installed in accordance with IBC Section 2603.4.1.6 or IRC Section R316.5.3 or R316.5.4, as applicable. The ignition barrier must be consistent with the requirements for the type of construction required by the applicable code and must be installed in a manner so that the foam plastic insulation is not exposed.

4.4.2 Application without a Prescriptive Ignition Barrier: ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 insulations may be installed in an attic or crawl space without a prescriptive ignition barrier when all of the following conditions apply:

- Entry to the attic or crawl space is only for the service of utilities and no storage is permitted.
- There are no interconnected attic or crawl space areas.
- Air in the attic or crawl space is not circulated to other parts of the building.
- Combustion air is provided in accordance with IMC (*International Mechanical Code*) Section 701.
- Attic ventilation is provided when required by IBC Section 1203.2 or IRC Section R806, except air-impermeable insulation is permitted in unvented attics in accordance with 2015 and 2012 IRC Section R806.5 (2009 IRC Section R806.4) or 2015 IBC Section 1203.3. Under-floor (crawl-space) ventilation is provided when required by 2015 IBC Section 1203.4 (2012 and 2009 IBC Section 1203.3) or IRC Section R408.1, as applicable. Refer to Section 3.4 for minimum thicknesses for use as air impermeable insulation.

The insulations may be spray-applied to the underside of roof sheathing and/or rafters in attics, and the underside of wood floors and/or floor joists in crawl spaces, as described in this paragraph and in Table 3. The maximum thickness of the foam plastic applied to the underside of the roof sheathing and to vertical wall surfaces must not exceed the thicknesses set forth in Table 3, based on the insulation type and the intumescent coating type and insulation thickness used. The intumescent coatings used to cover the foam plastic insulation are described in Section 3.5. The intumescent coating must be applied over the insulation in accordance with the coating manufacturer's instructions and at the thickness as described in Table 3. Surfaces to be coated must be dry, clean, and free of dirt, loose debris and other substances that could interfere with adhesion of the coating. The coating is applied with low-pressure airless spray equipment.

The coating must be applied with ambient and substrate temperature is at least 50°F (10°C). The insulation, at a minimum thickness of 3½ inches (89 mm), may be installed in unvented attics as described in this section in accordance with 2015 or 2012 IRC Section R806.5 (2009 IRC Section R806.4) or 2015 IBC Section 1203.3.

Exception: ENERTITE® IB-418 insulation may be installed in an attic or crawl space without a prescriptive ignition barrier or coating at the maximum thicknesses set forth in Table 3.

4.4.3 Use on Attic Floors:

4.4.3.1 ENERTITE® NM: When used on attic floors, ENERTITE® NM insulation may be installed at a maximum

thickness of 16 inches (406 mm) between joists. The ignition barrier in accordance with IBC Section 2603.4.1.6, or IRC Section R316.5.3, may be omitted, when the installation is in accordance with Section 4.4.2. The ENERTITE® NM insulation must be separated from the interior of the building by an approved thermal barrier.

4.4.3.2 ENERTITE® G: When used on attic floors, ENERTITE® G insulation may be installed at a maximum thickness of 16 inches (406 mm) between joists. The ignition barrier in accordance with IBC Section 2603.4.1.6, or IRC Section R316.5.3, may be omitted, when the installation is in accordance with Section 4.4.2. The ENERTITE® G insulation must be separated from the interior of the building by an approved thermal barrier.

4.4.3.3 ENERTITE® IB-418: ENERTITE® IB-418 insulation may be installed at a maximum thickness of 10 inches (254 mm) between joists in attic floors when installation is in accordance with Section 4.4.2. The ENERTITE® IB-418 insulation must be separated from the interior of the building by an approved thermal barrier.

4.5 Exterior Walls in Types I, II, III and IV Construction:

ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 insulations, when used in exterior walls of Types I, II, III or IV construction, the assembly must comply with IBC Section 2603.5, this section and Table 4. The insulation thickness must not exceed 6 inches (152 mm). The potential heat of ENERTITE® NM and ENERTITE® G insulation is 656 Btu/ft² per inch of thickness, when tested in accordance with NFPA 259. The potential heat of ENERTITE® IB-418 insulation is 522 Btu/ft² per inch of thickness, when tested in accordance with NFPA 259.

5.0 CONDITIONS OF USE

The ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 spray-applied polyurethane insulations described in this report complies with, or is a suitable alternative to what is specified in, those codes listed in Section 1.0 of this report, subject to the following conditions:

- This evaluation report and the manufacturer's published installation instructions, when required by the code official, must be submitted at the time of permit application.
- The insulation must be installed in accordance with the manufacturer's published installation instructions, this evaluation report and the applicable code. If there is a conflict between the installation instructions and this report, this report governs.
- The insulation must be separated from the interior of the building by an approved 15-minute thermal barrier, except when installed as described in Section 4.3.2 or when installation is in attics and crawl spaces as described in Section 4.4.
- The insulation must not exceed the thickness and density noted in Sections 3.2, 4.3 and 4.4.
- The insulation must be protected from the weather during and after application.
- The insulation must be applied by professional spray polyurethane foam installers approved by BASF Corporation or by the Spray Polyurethane Foam Alliance (SPFA) for the installation of spray polyurethane foam insulation.
- Use of the insulation in areas where the probability of termite infestation is "very heavy" must be in accordance with 2015 or 2009 IBC Section 2603.8

(2012 IBC Section 2603.9) or IRC Section R318.4, as applicable.

- 5.8 Jobsite certification and labeling of the insulation must comply with 2015 IRC Section N1101.10, 2012 IRC Section N1101.14 (2009 IRC Sections N1101.4 and N1101.4.1) or 2015 or 2012 IECC Sections C303.1, R303.1 and R401.3 (2009 IECC Section 303.1 and 401.3) (2009 IECC Sections 303.1.1 and 303.1.2), as applicable.
- 5.9 A vapor retarder must be installed in accordance with the applicable code.
- 5.10 The insulations are manufactured in Houston, Texas, under a quality control program with inspections by ICC-ES.

6.0 EVIDENCE SUBMITTED

- 6.1 Data in accordance with the ICC-ES Acceptance Criteria for Spray-applied Foam Plastic Insulation (AC377), dated May 2015.
- 6.2 Reports of room corner fire testing in accordance with NFPA 286 and UL 1715.
- 6.3 Reports of room corner fire testing in accordance with AC377 Appendix X.
- 6.4 Reports of air permeance testing in accordance with ASTM E283 and ASTM E2178.
- 6.5 Reports of critical radiant heat flux of exposed attic floor in accordance with ASTM E970.
- 6.6 Report of fire testing in accordance with NFPA 285, and related engineering analysis.
- 6.7 Report of potential heat tests in accordance with NFPA 259.

7.0 IDENTIFICATION

All packages and containers of ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 insulations must be labeled with the BASF Corporation, name and address; the product name; the flame spread index and the smoke-developed index; the shelf life expiration date; and the evaluation report number ([ESR-3702](#)).

International Fireproof Technology, Inc. / Paint to Protect Inc., DC 315 coating is labeled with the manufacturer's name and address; the product name; the date of manufacture, the shelf life or expiration date; the manufacturer's instructions for application, and evaluation report number ([ESR-3702](#)).

Fireshell F10E, coating is labeled with the manufacturer's name and address; the product name; the date of manufacture, the shelf life or expiration date; the manufacturer's instructions for application, and the evaluation report number ([ESR-3997](#)).

Intumescent coatings described in Sections 3.5.1, 3.5.2 and 3.5.4 are identified with the manufacturer's name and address, the product trade name and use instructions.

8.0 OTHER CODES

In addition to the codes referenced in Section 1.0, the products in the report were evaluated for compliance with the requirements of the following codes:

- 2006 and 2003 *International Building Code*®
- 2006 and 2003 *International Residential Code*®
- 2006 and 2003 *International Energy Conservation Code*®

The products comply with the above-mentioned codes as described in Sections 2.0 through 7.0 of this report, with the revisions noted below:

- **Application with a Prescriptive Thermal Barrier:** See Section 4.3.1, except the approved thermal barrier must be installed in accordance with Section R314.4 of the 2006 IRC or Section R314.1.2 of the 2003 IRC, as applicable.
- **Application with a Prescriptive Ignition Barrier:** See Section 4.4.1, except an ignition barrier must be installed in accordance with Section R314.2.3 of the 2003 IRC, or Section R314.5.3 or R314.5.4 of the 2006 IRC.
- **Application without a Prescriptive ignition Barrier:** See Section 4.4.2, except that combustion air is provided in accordance with Sections 701 and 703 of the 2006 IECC.
- **Protection against Termites:** See Section 5.7, except use of the insulation in areas where the probability of termite infestation if "very heavy" must be in accordance with Section 320.4 of the 2003 IRC or Section R320.5 of the 2006 IRC.
- **Jobsite Certification and Labeling:** See Section 5.8, except jobsite certification and labeling must comply with Section 102.5.1 of the 2003 IECC, or Sections 102.1.1 and 102.1.11, as applicable, of the 2006 IECC.

TABLE 1—THERMAL RESISTANCE (R-VALUES^{1,2})

ENERTITE® NM AND ENERTITE® G	
THICKNESS (inches)	R-VALUE (°F·ft ² ·h/Btu)
1	3.9
2	7.6
3	11
3.5	13

	10	14	ENERTITE® IB-418 Spray Foam 2 inches thick	2.0 inches	AC377, Appendix X
ENERTITE® IB-418	12	16	No covering required	N/A	AC377, Appendix X

For **SI**: 1 inch = 25.4 mm; 1 mil = 0.0254 mm; 1 gallon = 3.38 L; 1 ft² = 0.093 m².

¹See Section 4.4.2.

²See Sections 3.5.1, 3.5.2 and 3.5.4.

**TABLE 4—USE OF ENERTITE® NM AND ENERTITE® IB-814 IN EXTERIOR WALL CAVITIES
OF BUILDINGS OF TYPES I, II, III AND IV CONSTRUCTION**

WALL COMPONENT	MATERIALS
Base Wall System – Use either 1, 2 or 3	1 – Concrete wall ¹ 2 – Concrete masonry wall ¹ 3 – 1 layer of 5/8-inch-thick (15.9 mm) Type X gypsum wallboard installed on the interior side of minimum 3 5/8-inch-deep (92 mm), minimum 18 gauge thick steel studs spaced a maximum of 24 inches (610 mm) on center.
Perimeter Fire Barrier System	Perimeter fire barrier system complying with 2015 or 2012 IBC Section 715.4 (2009 IBC Section 714.4) shall be installed, as applicable, to fill the void between the edge of the concrete floor slab and the interior surface of the exterior wall assembly.
Interior Insulation – Use either 1, 2, 3, 4 or 5 or combinations of 3 and 4 or 3 and 5	1 – Maximum nominal thickness of 6 inches (152 mm) of ENERTITE® NM, ENERTITE® G or ENERTITE® IB-418 applied to the interior surface of Base Wall System 1 or 2 (See Note 1). 2 – Maximum nominal thickness of 6 inches (152 mm) of ENERTITE® NM, ENERTITE® G or ENERTITE® IB-418 applied using the back face of the exterior gypsum sheathing of Base Wall System 3 as the substrate and covering the width of the cavity and the inside of the steel wall stud framing flange. 3 – Fiberglass batt insulation ² 4 – Mineral wool insulation ²
Exterior sheathing	5/8-inch-thick (15.9 mm) Type X exterior-type gypsum sheathing (for Base Wall System 3)
Exterior Wall Covering	1 – Any non-combustible exterior wall covering material using any standard installation technique 2 – Any non-combustible exterior wall covering system with a combustible WRB that has successfully been tested in accordance with NFPA 285 Details of the exterior wall covering must be provided to the code official by the report holder, designer or specifier, with an engineering analysis demonstrating that (1) the exterior wall covering conforms to ASTM E136 and (2) the addition of the wall covering and/or water-resistive barrier to the assembly described in this section does not negatively affect conformance of the assembly with the requirements of IBC Section 2603.5.

¹ Fireblocking per Section 718 of the IBC and thermal barrier material requirements must be met for Base Wall Systems 1 and 2, as required by specific wall construction details when combustible concealed space is created on interior side of exterior wall assembly.

² Insulation must comply with the applicable requirements of 2015 or 2012 IBC Section 720.2 (2009 IBC Section 719.2).

ICC-ES Evaluation Report

ESR-3102 CBC, CRC and CEC Supplement

Reissued September 2017

Revised April 2018

This report is subject to renewal August 2018.

A Subsidiary of the International Code Council®

DIVISION: 07 00 00—THERMAL AND MOISTURE PROTECTION

Section: 07 21 00—Thermal Insulation

REPORT HOLDER:

BASF CORPORATION
1703 CROSSPOINT AVENUE
HOUSTON, TEXAS 77054
(713) 383-4554
www.spf.basf.com

EVALUATION SUBJECT:

ENERTITE® NM, ENERTITE® G AND ENERTITE® IB-418 OPEN-CELL SPRAY POLYURETHANE FOAM INSULATIONS

1.0 EVALUATION SCOPE

Compliance with the following codes:

- 2016 *California Building Code* (CBC)
- 2016 *California Residential Code* (CRC)
- 2016 *California Energy Code* (CEC)

Properties evaluated:

- Surface burning characteristics
- Physical properties
- Thermal resistance (*R*-values)
- Attic and crawl space installation
- Air permeability

2.0 PURPOSE OF THIS SUPPLEMENT

This supplement is issued to indicate that the ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 insulations described in Sections 2.0 through 7.0 of the master report ESR-3102 comply with the 2016 *California Building Code* (CBC), the 2016 *California Residential Code* (CRC), and the 2016 *California Energy Code* (CEC), when installed in accordance with the 2015 IBC and IRC provisions, as applicable, of the master evaluation report and the 2016 CEC under the following conditions:

- In accordance with Section 110.8 of the 2016 *California Energy Code*, verification of certification by the Department of Consumer Affairs, Bureau of Home Furnishings and Thermal Insulation, must be provided to the code official, demonstrating that the insulation conductive thermal performance is approved pursuant to the California Code of Regulations, Title 24, Part 12, Chapters 12-13, Article 3, "Standards for Insulating Material."
- The insulations have not been evaluated under CBC Chapter 7A or CRC Section R337, for use in the exterior design and construction of new buildings located in a Fire Hazard Zone within a State Responsibility Area or any Wildland–Urban Interface Fire Area.
- The insulations have not been evaluated for compliance with the *International Wildland–Urban Interface Code*®.

This supplement expires concurrently with the master report, reissued September 2017 and revised April 2018.

EVALUATION SUBJECT:

ENERTITE® NM, ENERTITE® G, AND ENERTITE® IB-418 OPEN-CELL SPRAY POLYURETHANE FOAM INSULATIONS

1.0 REPORT PURPOSE AND SCOPE

Purpose:

The purpose of this evaluation report supplement is to indicate that ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 open-cell spray-applied polyurethane foam insulations, recognized in ICC-ES master report ESR-3102, have also been evaluated for compliance with the codes noted below.

Applicable code editions:

- 2017 *Florida Building Code—Building*
- 2017 *Florida Building Code—Residential*

2.0 CONCLUSIONS

The ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 spray-applied polyurethane foam insulations described in Sections 2.0 through 7.0 of the master evaluation report comply with the *Florida Building Code—Building* and the *Florida Building Code—Residential*, provided the installation is in accordance with the 2015 *International Building Code*® (IBC) provisions noted in the master report under the following condition:

Installation must meet the requirements of Sections 1403.8 and 2603.8 of the *Florida Building Code—Building* and Sections R318.7 and R318.8 of the *Florida Building Code—Residential*, as applicable.

Use of ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 spray-applied polyurethane foam insulations has also been found to be in compliance with the High-Velocity Hurricane Zone provisions of the *Florida Building Code—Building* and the *Florida Building Code—Residential*, provided ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 spray-applied polyurethane foam insulations used in exterior walls of multistory buildings located in the High-Velocity Hurricane Zone, comply with Section 2612.3.2.4 of the *Florida Building Code—Building*.

For products falling under Florida Rule 9N-3, verification that the report holder's quality assurance program is audited by a quality assurance entity approved by the Florida Building Commission for the type of inspections being conducted is the responsibility of an approved validation entity (or the code official when the report holder does not possess an approval by the Commission).

This supplement expires concurrently with the master report, reissued September 2017 and revised April 2018.

ENERTITE® NM, ENERTITE® G and ENERTITE® IB-418 OPEN-CELL SPRAY POLYURETHANE FOAM INSULATIONS

1.0 EVALUATION SCOPE

Conformance to the following requirements:

Seal and Insulate with ENERGY STAR® Program—*Definitions and Testing Requirements for Residential Insulation, Version 1.0*

Properties evaluated:

- Thermal resistance
- Surface-burning characteristics

2.0 PURPOSE OF THIS SUPPLEMENT

This supplement is issued to certify that the ENERTITE® spray-applied foam plastic insulation products described in Sections 2.0 through 7.0 of the master report (ESR-3102) have been reviewed for compliance with the applicable codes noted in Section 1.0 of the master report and with the requirements set forth in the Seal and Insulate with ENERGY STAR® Program—*Definitions and Testing Requirements for Residential Insulation, Version 1.0*. The insulation products covered by this supplement are defined as "Spray or Pour Foam Insulation."

The requirements for testing laboratory qualifications and product sampling, as well as the specific material and test standards and editions used in this evaluation, are as set forth in the applicable documentation noted in Section 6.0 of the master evaluation report.

3.0 DEFINITIONS

The following definitions are from the *Definitions and Testing Requirements for Residential Insulation, Version 1.0*, and are applicable to the subject of this report.

3.1 General Definitions:

Insulation: Any material mainly used to slow down heat flow. It may be mineral or organic, fibrous, cellular, or reflective (aluminum foil). It may be in rigid, semi-rigid, flexible, or loose-fill form.

Residential Buildings: Single family homes (attached or unattached), multifamily buildings with 4 units or fewer, or multifamily buildings (condominiums, apartments) with 3 stories or less in height above grade.

3.2 Insulation Product Definition:

Spray or Pour Foam Insulation: A thermal insulating material that is sprayed or poured (as a gel or foamy liquid) into place, and expands or sets into a cellular foam and cures at the point of installation through a chemical reaction. Foamed materials include, but are not limited to polyurethane, polyisocyanurate, phenolic, and cementitious insulation.

3.3 Insulation Performance Definitions:

R-value: The inverse of the time rate of heat flow through a body from one of its bounding surfaces to the other surface for a unit temperature difference between the two surfaces, under steady state conditions, per unit area. For the purposes of the Seal and Insulate with ENERGY STAR program, only Imperial units will be accepted [(h·ft²·°F)/Btu].

Smoke-Development Index: The characteristic of a material to emit smoke when exposed to flame or fire compared to red oak and inorganic cement.

Flame-Spread Index: The characteristic of a material to resist the spreading of flames when exposed to flame or fire compared to red oak and inorganic cement.

3.4 Thermal Resistance:

The ENERTITE® spray-applied foam plastic insulations have thermal resistance *R*-values as noted in Table 1 of ESR-3102, based upon testing.

3.5 Installation

3.5.1 General: The installation of the ENERTITE® spray-applied foam plastic insulations must be in accordance with the requirements set forth in Sections 4.0 and 5.0 (as applicable) of ESR-3102. The insulation is manufactured on-site by spray polyurethane foam applicators meeting the qualification requirements stated in Section 5.6 of ESR-3102. The insulation should not be installed in direct contact with chimneys, flues or heat-producing appliances. See Figure 7 for recommended clearances.

3.5.2 Personal Protective Equipment (PPE): The following personal protective equipment (PPE) requirements are reprinted from the website of the American Chemistry Council (ACC) and deal with Spray Polyurethane Foam Health and Safety (<http://www.spraypolyurethane.org/PPE>):

“PPE for SPF High Pressure Interior Application:

When spraying an SPF two-component high pressure spray polyurethane foam system indoors, sprayers and helpers should wear:

- A NIOSH-approved full face or hood-type supplied air respirator (SAR) (as outlined in your company's Respiratory Protection Program)
- MDI-resistant chemical gloves (e.g., nitrile), or fabric gloves coated in nitrile, neoprene, butyl, or PVC
- Chemically resistant long-sleeve coveralls or chemically resistant full body suit with hood
- MDI-resistant fitted boots/booties”

“Protective Clothing:

The use of appropriate protective clothing is necessary whenever there is possibility of direct contact with SPF chemicals. The appropriate protective clothing varies depending upon the potential for exposure. Applicators and helpers typically wear disposable coveralls to keep spray and mist from contacting skin and clothing. To protect skin, wear PPE in such a manner as to protect all skin (in other words, there should be no exposed skin showing). When not wearing a hood respirator, select a coverall with an attached hood or spray head cover. For tasks where there is a potential for splash, consider a suit coated with an impermeable coating such as PVC and MDI-resistant fitted boots/booties.”

“Gloves:

Gloves made of nitrile, neoprene, butyl or PVC generally provide adequate protection against A-side materials. (See Guidance for the Selection of Protective Clothing for MDI Users, Center for the Polyurethane Industry (CPI) Guidance Document AX178). A-side protection is generally considered adequate to provide B-side protection; however, consult the manufacturer's SDS for specific information about B-side protection.”

“Eye and Face Protection:

Appropriate eye protection helps prevent eye contact from splashes of liquid SPF chemicals, accidental sprays of reacting foam, aerosols and vapors that are likely to be present during spraying, and airborne particulate associated with sanding and grinding operations. The type of eye protection needed depends on the nature of the activity.”

Persons handling liquid SPF chemicals in open containers can protect their eyes by wearing safety goggles or safety goggles in combination with face shields. The use of contact lenses is discouraged.

During application of SPF, eye protection may be provided by virtue of wearing a full-face or hood respirator. OSHA requires that an eyewash* or safety shower be provided in the work area where the eyes or body may be exposed to “injurious corrosive materials.” Consult the SDS for all materials to be used on the job in advance to help you understand whether such materials will be present, and if so, how to comply with applicable OSHA requirements.

“Respiratory Protection:

Engineering controls, such as local exhaust ventilation, can be used to control SPF chemical exposures. Administrative controls, such as work schedules and work practices, are used concurrently to minimize exposure. Respirators are needed when air concentrations continue to exceed occupational exposure limits when engineering and administrative controls are implemented. These limits have been set for a number of SPF chemicals and some common chemicals encountered during SPF application.

Air-purifying respirators (APR) and powered air-purifying respirators (PAPR) are generally appropriate for exterior applications and may be used when spraying polyurethane foam in exterior applications. Supplied air respirators (SAR) are

typically used in interior applications. Refer to the NIOSH Respirator Decision Logic (2004) for more information regarding respirator selection.”

Ventilation of the work area is required and should be in accordance with *Ventilation Considerations or Spray Polyurethane Foam: Guidance on Ventilation During Installation of Interior Applications of High-Pressure Spray Polyurethane Foam* as published by the Spray Foam Coalition (SFC) of the Center for the Polyurethanes Industry (CPI). The following statement regarding ventilation of the work area is reprinted from the guidance document:

“Work zone mechanical ventilation during and after SPF installation is designed to prevent workers and others in the area from being exposed to SPF chemicals above recommended or permissible levels. Potential health effects from exposure above recommended levels can range from no effects to slight irritation of the eyes, skin or respiratory system to the development of chronic lung or pulmonary disease depending on the individual person and level and duration of overexposure.”

3.5.3 Occupancy Time after Installation: The re-entry or re-occupancy time shall be in accordance with the manufacturer's installation instructions, which are reprinted on pages 4 and 5 of this certification.

3.5.4 Figures: Figures 1 through 6 represent general installations of the ENERTITE[®] spray-applied foam plastic insulations in vented and unvented crawl spaces, the interior of below-grade foundation walls, the exterior of above-grade walls, and in vented and unvented attics. Figure 7 depicts minimum clearances to heat-producing objects. These figures are for illustration purposes only and are not to be construed or used as construction documents.

This supplement expires concurrently with the master report, reissued September 2017 and revised April 2018.

The Chemical Company

BASF Re-Occupancy Times for Interior Building Spray Applications

Jim Andersen, Marketing Applications Specialist SR 021514

Introduction

The application of spray foam insulation is done through special high pressure spray application equipment, Low pressure application units or single component foams. This document will discuss two part foams field process using high pressure application equipment. When the combination of liquid part A compound and liquid B compound is done to produce either closed cell or open cell spray foam insulation there are potential health hazards during the application. OSHA and other government agencies have established protection requirements for all workers that can be exposed to the chemicals during the spray application. Only trained and properly protected workers are allowed in the spray application areas during the spraying and for a period after the spraying has stopped.

Requirements

The spray area should be posted with keep out WARNING signs before and after spraying. Workers only that are trained and have the necessary personal protection equipment are allowed inside the spray area. All others must be kept out as well as pets. Ventilation of the spray area is to be done incorporating the guidance documents: "Ventilation Guidance for Spray Polyurethane Foam Application," published by the U.S. Environmental Protection Agency (EPA), online at www.epa.gov/dfe/pubs/projects/spf/ventilation-guidance.html and "Good Practices – Engineering Controls and Ventilation," published by the American Chemistry Council's Center for the Polyurethanes Industry, available online at: www.spraypolyurethane.org/GoodPractices#EngineeringControls

The following general requirements must also be followed, Code of Federal Regulations Title 29 CFR §1926.20 Safety and Health Regulations for Construction: General Safety and Health Provisions available online at www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=STANDARDS&p_id=10606

The applicators and building owners should visit www.spraypolyurethane.org and also www.spf.basf.com for up to date information about spray polyurethane foam construction applications before starting projects.

Industry Established Re Occupancy Times

The Spray Foam Industry and government agencies have worked together to establish general guidelines for re occupancy. These can be found at www.spraypolyurethane.org. The general statement of 24 hours for re occupancy times for interior building applications is the general rule BASF suggests for two part high pressure spray.

"Evaluation reports for many types of building products, including SPF insulation, often include the suggested reoccupancy time, which is variable: for an interior application using two-component high-pressure SPF, some manufacturers recommend 24 hours before reoccupancy, and for an interior two-component, low-pressure SPF kit application, some manufacturers recommend a one hour reoccupancy time. Consult the product manufacturer to determine the recommended reoccupancy time for the particular job and SPF in use.

Note: "Exterior applications where the spray application is done to a roof top application or exterior walls and where there is wide open air spaces; the risk control is done by closing off all air intake areas to a building interior,(windows, doors, warning signs and HVAC intake vents). Roof or exterior applications will generally have plenty of ventilation with natural wind as well as massive volumes of space to dissipate the concentration of materials. Therefore the controls used for interior applications are not generally required, such as added ventilation. The elastomeric roof coatings vary in risks and must be assessed and the risks evaluated on a job by job and material specific basis by the spray foam applicator company.

BASF Re Occupancy Research

BASF, Air Products and Honeywell have conducted proprietary studies for indoor air quality measurements on spray foam applications to retrofit attics. Robert, William, James Andersen, Richard Wood, and Mary Bogdan. "Ventilation and Re-Occupancy of a Residential Home Sprayed with High Pressure Polyurethane Foam." Presented at the CPI Technical Conference, September 2012

This study of three houses where the attic was sealed and ventilated during the spray application has resulted in no chemicals detected within the house at levels greater than those currently assigned levels by government agencies and private chemical manufactures' Material Safety Data Sheets (MSDS) or Safety Data Sheets (SDS).

This particular application process indicates 2 hours after spraying has stopped and ventilation continued that re-occupancy can occur within the homes. The spray foam was done above the sheetrock in non inhabited attic spaces.

BASF continues field monitoring testing as well as supports continued research being done by the American Chemistry Council/Center for the Polyurethane Industries of which we are an active member.

Summary

This information has been provided for use by our spray foam applicators and distributors use. It may also be used to inform end customers who have contracted to have spray foam produced by spray foam applicators to their buildings. It is offered in good faith and believed to present the risks and best industry practices to manage them. Since each field application is different the responsibility rests with spray foam applicators to assess the job risks and control them per the OSHA and others requirements. Technical Questions can be directed to BASF Technical Services 800-706-0712.
