1.0 EVALUATION SCOPE

Compliance with the following codes:

- 2021, 2018, 2015 and 2012 [International Building Code® \(IBC\)](#)
- 2021, 2018, 2015 and 2012 [International Residential Code® \(IRC\)](#)

For evaluation for compliance with codes adopted by California Office of Statewide Health Planning and Development (OSHPD) and Division of the State Architect (DSA), see [ESR-2024 CBC and CRC Supplement](#).

Property evaluated:

Structural

2.0 USES

The power-driven fasteners are used to attach building elements such as wood and cold-formed steel to base materials of: uncracked, normalweight and sand-lightweight concrete; cold-formed steel decks with sand-lightweight concrete fill; concrete masonry and structural steel.

The fasteners, which include pins (with and without washers) and threaded studs, are alternatives to the cast-in-place anchors described in IBC Section 1901.3 (2012 IBC Section 1908) for placement in concrete; the embedded anchors described in Section 8.1.3 of TMS 402, referenced in IBC Section 2107 (Section 2.1.4 of TMS 402, referenced in Section 2107 of the 2012 IBC) for placement in masonry; and the welds and bolts used to attach materials to steel described in IBC Sections 2204.1 and 2204.2, respectively.

Select fasteners are alternatives to the cast-in-place anchors described in IBC Section 2308.3.1 (2012 IBC Section 2308.6) and IRC Section R403.1.6 for anchorage of wood sills to concrete. The fasteners are also used as components of the ceiling clip assemblies, which are used to fasten suspended ceiling systems to the supporting structure. For structures regulated under the IRC, the fasteners may be used where an engineered design is submitted in accordance with IRC Section R301.1.3.

3.0 DESCRIPTION

3.1 Power-driven Fasteners:

The power-driven fasteners are low-velocity power-driven fasteners manufactured from hardened steel complying with the manufacturer's quality documentation; and are zinc-plated in accordance with ASTM B695, Class 5, Type 1 unless otherwise noted. Product names for the report holder and additional listee are presented in the table below:

COMPANY NAME	PRODUCT NAME
DEWALT	Power-driven Fasteners and Ceiling Clips
Max Co., Ltd.	Powerlite Fasteners

See [Figure 3](#) for representative images of the fasteners and [Table A](#) for dimensional properties.

3.1.1 0.300-inch Head Drive Pins: These fasteners have a head diameter of 0.300-inch (7.62 mm) and either a smooth or knurled shank with a diameter of 0.145 inch (3.7 mm). The single fasteners have premounted plastic guide washers. These fasteners are also available with premounted top hat washers. The mechanically galvanized (MG) version of these fasteners have premounted plastic guide washers and are zinc-plated in accordance with ASTM B695, Class 55.

3.1.2 8 mm Head Drive Pins: These fasteners have a head diameter of 8 mm (0.315 inch), a smooth or knurled shank with a diameter of 0.145 inch (3.7 mm). The single fasteners have premounted plastic guide washers. These fasteners are also available with premounted top hat washers or in collated strips.

3.1.3 CSI Spiral Pins: These fasteners have a head diameter of 8 mm (0.32 inch) and a spiral shank with a diameter of 0.157 inch (4.0 mm). The single fasteners have premounted plastic guide washers. These fasteners are also available in collated strips.

3.1.4 CSI Spiral Taper Shank Pins: These fasteners have a head diameter of 8 mm (0.32 inch) and a spiral taper shank with a diameter of 0.145 inch (3.7 mm) at the largest portion of the shank. The single fasteners have premounted plastic guide washers. These fasteners are also available in collated strips.

3.1.5 CSI Spiral Step Shank Pin: These fasteners have a head diameter of 8 mm (0.32 inch); and a stepped, spiral shank with diameters of 0.145 and 0.125 inch (3.7 and 3.2 mm). The single fasteners have premounted plastic guide washers. These fasteners are also available in collated strips.

3.1.6 Ballistic Point Drive Pins: These fasteners have a head diameter of 0.300 inch (7.62 mm) and a smooth shank with a diameter of 0.150 inch (3.8 mm). Single fasteners have a premounted plastic guide washer. The fasteners are coated with a black polymer or are zinc plated.

3.1.7 Threaded Studs: These fasteners have a straight shank at the end of the fastener that is power-driven into the substrate and threads at the other end. The threaded studs are available with $\frac{1}{4}$ -inch-20 or $\frac{3}{8}$ -inch-16 thread diameters with a variety of thread and shank lengths. The $\frac{1}{4}$ -inch-20 threaded studs have a smooth or knurled shank diameter of 0.145 inch (3.7 mm), while the $\frac{3}{8}$ -inch-16 threaded studs have a smooth shank diameter of 0.205 inch (5.2 mm). The single fasteners have a premounted plastic guide washer.

3.2 Ceiling Clip Assemblies:

The power-driven ceiling clip assemblies are comprised of a power-driven fastener with a premounted steel angle clip for attachment of ceiling wire or a premounted steel clip with a post-nut accessory for attachment of threaded rod. The assemblies may also include premounted washers. The clips are manufactured from carbon steel and are zinc-plated in accordance with ASTM B695, Class 5, Type 1. See [Figure 3](#) for images of the ceiling clip assemblies.

3.2.1 0.300-inch Head Drive Pin Ceiling Clip Assemblies: Both standard and economy ceiling clip assemblies are available and are comprised of the smooth shank head drive pins, described in Section 3.1.1 and a standard or economy clip, respectively. The standard ceiling clip assemblies are available with a regular length clip or an extended length (XL) clip, which have a 90 degree angle and are manufactured from 0.080-inch-thick (2.0 mm) steel. The economy clips have a 60-degree angle and are manufactured from 0.075-inch-thick (1.9 mm) steel.

3.2.2 8 mm Head Drive Pin Ceiling Clip Assemblies: The assemblies are comprised of the smooth shank head drive pins described in Section 3.1.2 and the standard ceiling clip described in Section 3.2.1.

3.2.3 CSI Spiral Pin Ceiling Clip Assemblies: The assemblies are comprised of the spiral shank pin described in Section 3.1.3 and a 90-degree angle clip manufactured from 0.079-inch-thick (2.0 mm) steel.

3.2.4 Post Nut Hanger Ceiling Clip Assemblies: The Post Nut Hanger Ceiling Clip Assembly is a 0.300-inch head standard ceiling clip assembly, described in Section 3.2.1, with a factory- assembled post-nut (threaded eye coupling nut) attachment that accepts $1/4$ -20 threaded rod or bolts. The post nut is zinc-plated in accordance with ASTM B695 Class 5, Type 1. The post-nut hanger ceiling clip assemblies are available with a regular length clip or clip with an extended length (XL).

3.2.5 Ballistic Point Drive Pin Ceiling Clip Assembly: The Ballistic Point Drive Pin Ceiling Clip Assembly is comprised of a Ballistic Point Drive Pin described in Section 3.1.5 and a steel clip. The clips have a 90-degree angle and are manufactured from 0.080-inch-thick (2.0 mm) steel.

3.3 Washered Pin Assemblies:

The Washered Pin Assemblies are comprised of a head drive pin described in Section 3.1.1, 3.1.2 or 3.1.3 and a premounted washer manufactured from low-carbon steel. A number of different washers are available. The washered pin assemblies are zinc-plated in accordance with ASTM B695, Class 5, Type 1, except for mechanically galvanized (MG) washered pin assemblies which are zinc plated in accordance with ASTM B695, Class 55. See [Figure 3](#) for typical washered pin assemblies.

3.4 Substrate Material:

3.4.1 Concrete: Normalweight and sand-lightweight concrete must conform to IBC Chapter 19 or IRC Section R402.2, as applicable. The minimum concrete compressive strength at the time of fastener installation is noted in [Tables 1A, 1B, 1C, 2A](#) and [2B](#).

3.4.2 Concrete Masonry: Concrete masonry units (CMUs) must be minimum 8-inch-thick (203 mm) normalweight or lightweight blocks conforming to ASTM C90, as noted in [Table 5](#). Mortar must be Type N, M or S complying with ASTM C270. Grout must be coarse grout complying with ASTM C476. Concrete masonry walls must have a minimum compressive strength, f'_m , of 2,000 psi (13.8 MPa), as applicable.

3.4.3 Steel Substrates: Structural steel must comply with the minimum requirements of ASTM A36, ASTM A572 Grade 50, or ASTM A992, and have a minimum thickness as shown in [Tables 6A, 6B, 7A](#) and [7B](#).

3.4.4 Steel Deck Panels: The steel deck properties and configurations must be as described in the footnotes of [Tables 3A, 3B, 4A](#) and [4B](#) and in [Figures 1A](#) or [1B](#), as applicable.

3.5 Sill Plates: The sill plates must be nominally 2-inch-thick lumber that is naturally durable wood complying with the definition in IBC Section 202 or IRC Section R202, as applicable, or wood that has been preservative-treated in accordance with IBC Section 2303.1.9 (2012 IBC Section 2303.1.8) or IRC Section R317.1, as applicable.

4.0 DESIGN AND INSTALLATION

4.1 Design:

4.1.1 General: Selection of fasteners must take into consideration the applicable base material and the length of the fastener. The minimum fastener length must be determined as follows:

- For installation into concrete, concrete-filled cold-formed steel deck panels, concrete masonry and steel base materials, the minimum effective shank length shown in [Table A](#) must equal or exceed the sum of the thickness of the attached material and the minimum embedment depth (penetration) shown in the applicable tables in this report.
- For installation through steel base materials, the minimum effective shank length shown in [Table A](#) must equal or exceed the sum of the following: the thickness of the attached material, the thickness of the base material and the required point penetration shown in the applicable tables in this report.

4.1.2 Allowable Loads: The applicable allowable load tables for fasteners driven into different base materials may be determined by referencing [Table A](#).

The tabulated allowable loads are applicable to the fastener in the base material and the capacity of premounted ceiling clips only. The connection capacity of the materials attached to the base materials, and of the wire or rod connected to the ceiling clip assemblies, must be determined in accordance with accepted design criteria and the applicable requirements of the IBC.

The most critical applied loads, excluding seismic load effects, resulting from the load combinations in Section 2.4 of ASCE 7-16/S1 (referenced in 2021 IBC Section 1605.1) or 2021 IBC Section 1605.2 (Section 1605.3.1 or 1605.3.2 of the 2018, 2015 and 2012 IBC) must not exceed these allowable loads. For fasteners which are subjected to seismic loads, see Section 4.1.6 for additional information. The stress increases and load reductions described in 2021 IBC Section 1605.2 (2018, 2015 and 2012 IBC Section 1605.3) are not allowed.

The allowable tension (pull-out) and shear loads listed in this report apply only to the connection of the fastener to the base materials. Other limit states applicable to the design of a connection, such as fastener pull-through (pull-over) and lateral bearing on the attached material, which are governed by the properties of attached materials, are outside the scope of this report. Design of the connection to the attached material must comply with the applicable requirements of the IBC. When designing the connection of wood members to base materials, the bending yield strength of the power-driven fasteners can be assumed to be the same as that of a nail with the same shank diameter.

4.1.3 Combined Loading: For fasteners subjected to tension and shear loads, compliance with the following interaction equation must be verified:

$$(p/P_a) + (v/V_a) \leq 1$$

where:

p = Actual applied tension load on fastener, lbf (N).

P_a = Allowable tension load for the fastener, lbf (N).

V = Actual applied shear load on fastener, lbf (N).

V_a = Allowable shear load for the fastener, lbf (N).

4.1.4 Steel-to-steel Connections: When the fasteners listed in [Table 6A](#) and [Table 6B](#) are used in connections of two steel elements in accordance with Section J5 of AISI S100 (Section E5 of AISI S100-12 for the 2015 and 2012 IBC), connection capacity must be determined in accordance with Sections 4.1.4.1 and 4.1.4.2, as applicable.

4.1.4.1 Connection Strength - Tension: To determine tensile connection strength in accordance with Section J5.2 of AISI S100 (Section E5.2 of AISI S100-12), the fastener tension strength, pull-out strength and pull-over strength must be known. These characteristics must be determined as follows:

- **Tensile Strength:** The available tension strengths must be calculated in accordance with Section J5.2.1 of AISI S100 (Section E5.2.1 of AISI S100-12) using a value of 260,000 psi for F_{uh} .
- **Pull-out Strength:** See [Table 6A](#) and [Table 6B](#) for available pull-out strength, as applicable.
- **Pull-over Strength:** The available pull-over strengths must be calculated in accordance with Section J5.2.3 of AISI S100 (Section E5.2.3 of AISI S100-12).

4.1.4.2 Connection Strength - Shear: To determine shear connection strength in accordance with Section J5.3 of AISI S100 (Section E5.3 of AISI S100-12), the fastener shear strength, bearing and tilting strength, pull-out strength in shear, net section rupture strength and shear strength limited by edge distance must be known. These characteristics must be determined as follows:

- **Shear Strength:** The available shear strengths must be calculated in accordance with Section J5.3.1 of AISI S100 (Section E5.3.1 of AISI S100-12) using a value of 260,000 psi for F_{uh} .
- **Bearing and Tilting Strength:** The available bearing and tilting strengths must be calculated in accordance with Section J5.3.2 of AISI S100 (Section E5.3.2 of AISI S100-12).
- **Pull-out Strength in Shear:** The available pull-out strength in shear must be the applicable allowable shear strength from [Tables 6A](#) and [6B](#), or must be calculated in accordance with Section J5.3.3 of AISI S100 (Section E5.3.3 of AISI S100-12).

- **Net Section Rupture Strength and Shear Strength Limited by Edge Distance:** The net section rupture strength must be determined in accordance with Section J5.3.4 of AISI S100 (Section E5.3.4 of AISI S100-12) and the shear strength limited by edge distance must be determined in accordance with Section J5.3.5 of AISI S100 (Section E5.3.5 of AISI S100-12).

4.1.5 Sill Plate to Foundation Connections:

Allowable shear and tension loads for fasteners used to attach wood sill plates to concrete are provided in [Table 8A](#). The bearing area and thickness of the washers are also given in [Table 8A](#). For shear loads, spacing of fasteners must be determined based on the lesser of the allowable shear load from [Table 8A](#) and the allowable load on the fastener/wood sill plate/concrete foundation interaction, determined in accordance with the ANSI/AWC National Design Specification (NDS) for Wood Construction, with a fastener bending yield strength, $F_{yb} = 90,000$ psi (621 MPa) and a concrete dowel bearing strength, $F_e = 7,500$ psi (52 MPa). For tension loads, spacing of fasteners must be determined based on the lesser of allowable tension load from [Table 8A](#) and pull through capacity of the wood sill plate, based on Section 3.10 of the NDS, using the washer bearing area from [Table 8A](#). For fasteners subject to combined tension and shear loads, compliance with Section 4.1.3 must be verified.

4.1.6 Seismic Considerations: The fasteners and ceiling clip assemblies have been evaluated for use when subjected to seismic loads as follows:

1. The fasteners may be used for attachment of nonstructural components listed in Section 13.1.4 of ASCE 7, which are exempt from the requirements of ASCE 7.
2. Concrete base materials: The fasteners and assemblies installed in concrete may be used to support acoustical tile or lay-in panel suspended ceiling systems, distributed systems and distribution systems where the service load on any individual fastener does not exceed the lesser of 90 lbf (400 N) or the published allowable load in [Tables 1A, 1B, 1C, 2A, 2B, 3A, 3B, 4A](#) or [4B](#) as applicable.
3. Steel base materials: The fasteners and assemblies installed in steel may be used where the service load on any individual fastener does not exceed the lesser of 250 lbf (1112 N) or the published allowable load shown in [Tables 6A, 6B, 7A](#) or [7B](#), as applicable.
4. For interior, nonstructural walls that are not subject to sustained tension loads and are not a bracing application, the fasteners may be used to attach steel track to concrete or steel in all Seismic Design Categories. In Seismic Design Categories D, E, and F, the allowable shear load due to transverse pressure must be no more than 90 pounds (400 N) when attaching to concrete; or 250 pounds (1,112N) when attaching to steel. Substantiating calculations must be submitted addressing the fastener-to-base-material capacity and the fastener-to-attached-material capacity. Interior nonstructural walls are limited to locations where bearing walls, shear walls or braced walls are not required by the approved plans. The design load on the fastener must not exceed the allowable load established in this report for the concrete or steel base material.
5. The fasteners listed in [Table 8A](#) may be used to attach wood sill plates to concrete for structural walls in Seismic Design Categories A and B. The fasteners listed in [Table 8B](#) may be used to attach wood sill plates to concrete for interior, nonstructural walls [maximum horizontal transverse load on the wall must not exceed 5 psf (0.24 kN/m²)] in Seismic Design Categories A through F, when installed as described in [Table 8B](#).

4.2 Installation:

4.2.1 General: Fasteners must be installed with a power-actuated fastening tool in accordance with the manufacturer's published installation instructions. A copy of these instructions must be available on the jobsite at all times during fastener installation. Installers using a low-velocity powder-actuated tool during fastener installation must have a current operator's license for projects under the IBC.

The fastener size, minimum embedment depth or penetration, minimum spacing, and edge distances must comply with [Tables 1A](#) through [7B](#) of this report, as applicable. For fasteners installed into concrete, the fasteners must not be driven until the concrete has reached the designated compressive strength.

4.2.2 Use with Treated Lumber:

The mechanically galvanized 0.300-inch Head Drive pins described in Section 3.1.1 and the mechanically galvanized washered pin assemblies described in Section 3.3, which have a ASTM B695, Class 55 mechanically galvanized coating, may be used in contact with preservative-treated wood in dry, interior locations only in accordance with IBC Section 2304.10.6.1 (2018 and 2015 IBC Section 2304.10.5.1, 2012 IBC

Section 2304.9.5.1). These products may also be used in contact with fire-retardant-treated wood in dry, interior locations only, in accordance with IBC Section 2304.10.6.4 (2018 and 2015 IBC Section 2304.10.5.4, 2012 IBC Section 2304.9.5.4) and the report holder's recommendations.

Any power-driven fasteners described in this report may be used in contact with wood treated with SBX/DOT and zinc borate preservatives in dry, interior locations only, in accordance with the exception to IBC Section 2304.10.6.1 (2018 and 2015 IBC Section 2304.10.5.1, 2012 IBC Section 2304.9.5.1).

5.0 CONDITIONS OF USE:

The power-driven fasteners, ceiling clip assemblies and sill plate anchorage described in this report comply with, or are suitable alternatives to what is specified in, those codes listed in Section 1.0 of this report, subject to the following conditions:

- 5.1 The fasteners must be manufactured and identified in accordance with this report.
- 5.2 The fasteners must be installed in accordance with this report and the manufacturer's published installation instructions. In the event of a conflict between this report and the manufacturer's published installation instructions, the more restrictive requirements govern.
- 5.3 Calculations demonstrating that the applied loads are less than the allowable loads described in this report must be submitted to the code official for approval. The calculations must be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed.
- 5.4 For steel-to-steel connections that meet the applicability requirements of Section J5 of AISI S100 (Section E5 of AISI S100-12 for the 2015 and 2009 IBC), calculations demonstrating that the available connection strength has been determined in accordance with Section J5 of AISI S100 (Section E5 of AISI S100-12) and Section 4.1.4 of this report, and equals or exceeds the applied load, must be submitted to the code official. The calculations must be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed.
- 5.5 The use of the fasteners in this report is limited to installation in dry, interior environments, which include exterior walls which are protected by an exterior wall envelope.
- 5.6 The use of fasteners is limited to installation in uncracked concrete or masonry. Cracking occurs when $f_t > f_r$, due to service loads or deformations.
- 5.7 Installation must comply with Section 4.2.2 regarding fasteners in contact with preservative-treated or fire-retardant-treated wood.
- 5.8 See Section 4.1.6 of this report for seismic considerations.
- 5.9 The products addressed in this report are manufactured under a quality control program with inspections by ICC-ES.

6.0 EVIDENCE SUBMITTED

Data in accordance with the [ICC-ES Acceptance Criteria for Power-actuated Fasteners Driven into Concrete, Steel, and Masonry Elements \(AC70\)](#), dated December 2019 (editorially revised January 2021).

7.0 IDENTIFICATION

7.1 The power-driven fasteners are identified by a "D" or a "P" stamped onto the head of the drive pin. Packages bear one of the company names set forth in Section 3.1, the fastener catalog number, the fastener length and diameter, and the evaluation report number (ESR-2024).

7.2 The report holder's contact information is the following:

For SI: 1 inch = 25.4 mm

¹Maximum point length is the maximum specified length from the tip of the fastener to the location where the diameter of the shank becomes constant.

²Unless otherwise noted, minimum effective shank length is the minimum specified length from the underside of the fastener head to the tip of the fastener.

³Minimum effective shank length for threaded studs is the minimum specified length from the bottom of the threads to the tip of the fastener.

TABLE 1A—ALLOWABLE LOADS FOR FASTENERS DRIVEN INTO NORMALWEIGHT CONCRETE (lbf)^{1,2,3}

FASTENER DESCRIPTION	SHANK DIAMETER (inch)	EMBEDMENT DEPTH (inches)	MINIMUM SPACING (inches)	MINIMUM EDGE DISTANCE (inches)	f'c = 2,500 psi		f'c = 3,000 psi		f'c = 4,000 psi

TABLE 1C—ALLOWABLE LOADS FOR FASTENERS DRIVEN INTO NORMALWEIGHT CONCRETE (lbf)^{1,2,3}

FASTENER DESCRIPTION	SHANK DIAMETER (inch)	EMBEDMENT DEPTH (inches)	MINIMUM SPACING (inches)	MINIMUM EDGE DISTANCE (inches)	f'c = 2,500 psi		f'c = 3,000 psi		f'c = 4,000 psi		f'c = 6,000 psi	
					Tension	Shear	Tension	Shear	Tension	Shear	Tension	Shear
CSI Spiral Pins	0.157	3/4	4	3 1/2	120	170	130	190	270	380	-	-
		1			195	245	225	280	270	520	205	300
		1 1/4			310	385	340	420	475	575	205	380

For SI: 1 lbf = 4.48 N, 1 inch = 25.4 mm, 1 psi = 6.895 kPa.

Notes for Tables 1A, 1B and 1C:

¹Fasteners must not be driven until the concrete has reached the designated compressive strength.

²Concrete thickness must be a minimum of three times the embedment depth of the fastener.

³The fasteners listed in the table above may be used for static load conditions and for the seismic load conditions described in Section 4.1.6 of this report, as applicable. The tabulated allowable loads apply to static load conditions; for seismic load conditions, the allowable loads must be limited in accordance with Section 4.1.6, Items 2 and 4, as applicable.

For SI: 1 lbf = 4.48 N, 1 inch = 25.4 mm, 1 psi = 6.895 kPa, 1 ksi = 1,000 psi.
N/A = Not applicable.

Notes for Tables 3A and 3B:

- ¹Fasteners must not be driven until the concrete has reached the minimum designated compressive strength.
- ²For fasteners installed directly into concrete, the concrete thickness must be a minimum of three times the embedment depth but not greater than 3 1/4 inches.
- ³The steel deck profile for the 3-inch deep composite floor deck panel have a minimum base metal thickness of 0.036 inch and minimum yield and tensile strengths (F_y and F_u) equal to 33 ksi and 45 ksi, respectively.
- ⁴The steel deck profile for the 3-inch deep composite floor deck panel have a minimum base metal thickness of 0.034 inch and minimum yield and tensile strengths (F_y and F_u) equal to 40 ksi and 55 ksi, respectively.
- ⁵The fasteners and assemblies listed in the table above may be used for static load conditions and for the seismic load conditions described in Section 4.1.6 of this report, as applicable. The tabulated allowable loads apply to static load conditions; for seismic load conditions, the allowable loads must be limited in accordance with Section 4.1.6, Items 2 and 4, as applicable.
- ⁶Fasteners may be installed in 2,500 psi sand-lightweight concrete provided the allowable loads are multiplied by a factor of 0.87.

Installation must comply with Figure:					1A											

For SI: 1 lbf = 4.48 N, 1 inch = 25.4 mm, 1 psi = 6.895 kPa, 1 ksi = 1,000 psi.

N/A = Not applicable.

Notes for Tables 4A and 4B:

¹Fasteners must not be driven until the concrete has reached the minimum designated compressive strength.

²For fasteners installed directly into concrete, the concrete thickness must be a minimum of three times the embedment depth of the fastener but not greater than 3¼ inches.

³The steel deck profile for the composite floor deck panels have a minimum thickness of 0.036 inch and minimum yield and tensile strengths (F_y and F_u) equal to 33 ksi and 45 ksi, respectively.

⁴The steel deck profile for the composite floor deck panels have a minimum thickness of 0.034 inch and minimum yield and tensile strengths (F_y and F_u) equal to 40 ksi and 55 ksi, respectively.

⁵The fasteners and assemblies listed in the table above may be used for static load conditions and for the seismic load conditions described in Section 4.1.6 of this report, as applicable. The tabulated allowable loads apply to static load conditions; for seismic load conditions, the allowable loads must be limited in accordance with Section 4.1.6, Items 2 and 4, as applicable.

TABLE 5—ALLOWABLE LOADS FOR FASTENERS DRIVEN INTO CONCRETE MASONRY UNITS^{1,6,7,8}

FASTENER DESCRIPTION	SHANK DIAMETER (inch)	EMBEDMENT DEPTH (inch)	MIN. END AND EDGE DISTANCE (inches)	ALLOWABLE LOADS (lbf)									
				HOLLOW CMU				GROUTED CMU					
Masonry Type:				Face Shell ²		Horizontal Mortar Joint ⁵		Face Shell ²		Horizontal Mortar Joint ⁵		Top and Center of Grouted Wall	
Fastener Location:				Tension	Shear ³	Tension	Shear ⁴	Tension	Shear ³	Tension	Shear ⁴	Tension	Shear ³
Load Direction:				Tension	Shear ³	Tension	Shear ⁴	Tension	Shear ³	Tension	Shear ⁴	Tension	Shear ³
0.300-inch Head Drive Pins	0.145	1	3 3/4	-	-	-	-	150	155	140	170	45	115
CSI Spiral Pins	0.157	1	3 3/4	185	210	70	115	140	165	120	185	120	145
1/4-inch-20 Threaded Studs	0.145	1	3 3/4	185	180	60	120	175	220	135	220	-	-

For SI: 1 lbf = 4.4 N, 1 inch = 25.4 mm.

¹Concrete masonry units (CMU) must be normalweight units for hollow CMU walls and lightweight units for grouted CMU walls and must conform to ASTM C90. The minimum nominal size of the CMU must be 8 inches high by 8 inches wide by 16 inches long, with a minimum 1/4-inch-thick face shell thickness.

²Only one fastener may be installed in each cell.

³Shear loads for fasteners installed in the face shell or in the top of grouted cells may be applied in any direction.

⁴Shear loads for fasteners installed into the horizontal mortar joint may be applied in any direction along the CMU wall plane.

⁵Mortar must be Type N, M or S complying with ASTM C270. Allowable loads may be increased by 50 percent for joint installations into Type M or S mortar.

⁶Allowable loads for fasteners installed into vertical mortar joints, including the intersection of the head joint and bed joint, are outside the scope of this report.

⁷Fasteners must be installed a minimum of 1 3/4 inches from the vertical mortar joints.

⁸The fasteners listed in the table above may be used for static load conditions and for the seismic load conditions described in Item 1 of Section 4.1.6 of this report.

For SI: 1 lbf = 4.48 N, 1 inch = 25.4 mm.

Notes for Table 6A and 6B:

- ¹To obtain the tabulated values, the entire pointed portion of the fastener must penetrate the steel, unless otherwise noted.
- ²The minimum spacing is 1 inch center-to-center, and minimum edge and end distances are 1/2 inch, unless otherwise noted.
- ³Fasteners must have a minimum spacing of 1 1/2 inches center-to-center, and minimum edge and end distances are 1/2 inch.
- ⁴The fasteners must be embedded a minimum of 0.50 inch into the steel. Fastener point penetration through the steel is not necessary provided the minimum embedment is achieved.
- ⁵The fasteners must be embedded a minimum of 0.43 inch into the steel. Fastener point penetration through the steel is not necessary provided the minimum embedment is achieved.
- ⁶The fasteners must be embedded a minimum of 0.45 inch into the steel. Fastener point penetration through the steel is not necessary provided the minimum embedment is achieved.
- ⁷The fasteners must be embedded a minimum of 0.41 inch into the steel. Fastener point penetration through the steel is not necessary provided the minimum embedment is achieved.
- ⁸The fasteners listed in the table above may be used for static load conditions and for the seismic load conditions described in Section 4.1.6 of this report, as applicable. The tabulated allowable loads apply to static load conditions; for seismic load conditions, the allowable loads must be limited in accordance with Section 4.1.6, Items 3 and 4, as applicable.
- ⁹For steel-to-steel connections designed in accordance with Section 4.1.4, the tabulated allowable load (ASD) may be increased by a factor of 1.25, and the design strength (LRFD) may be taken as the tabulated allowable load multiplied by a factor of 2.0 when the pointed portion penetration protrude past the steel.
- ¹⁰Steel base material must have minimum yield and tensile strengths (F_y and F_u) equal to 36 ksi and 58 ksi, respectively for A36 steel.
- ¹¹Steel base material must have minimum yield and tensile strengths (F_y and F_u) equal to 50 ksi and 65 ksi, respectively for A572 Grade 50 or A992 steel.

TABLE 7A—ALLOWABLE LOADS FOR CEILING CLIP ASSEMBLIES DRIVEN INTO STEEL (lbf)^{1,2,4,5}

ASSEMBLY DESCRIPTION	SHANK DIAMETER (inch)	SHANK TYPE	ASTM A36						ASTM A572 GRADE 50 / A992			
			1/8-INCH THICK		1/4-INCH THICK		3/8-INCH THICK		1/4-INCH THICK		3/8-INCH THICK	
			Tension	Shear	Tension	Shear	Tension	Shear	Tension	Shear	Tension	Shear
0.300-inch Head Standard Ceiling Clip Assemblies	0.145	Smooth	140	350	345	385	190	255	375	415	205	275
Ballistic Point Pin Ceiling Clip Assemblies	0.150	Smooth	-	-	350	510	190	240	380	550	205	255
Post Nut Hanger Ceiling Clip Assemblies (regular length clip)	0.145	Smooth	140	-	345	-	190	-	375	-	205	-

TABLE 7B—ALLOWABLE LOADS FOR CEILING CLIP ASSEMBLIES INSTALLED INTO STEEL (lbf)^{1,3,4,5}

ASSEMBLY DESCRIPTION	SHANK DIAMETER (inch)	SHANK TYPE	ASTM A36 OR ASTM A572 GRADE 50 / A992		
			1/4-INCH THICK		
			Tension	45°	Shear
CSI Spiral Pin Ceiling Clip Assemblies	0.157	Spiral	350	390	420

For SI: 1 lbf = 4.48 N, 1 inch = 25.4 mm.

Notes for Table 7A and 7B:

- ¹To obtain the tabulated values, the entire pointed portion of the fastener must penetrate the steel.
- ²The minimum fastener spacing is 1 inch center-to-center, and minimum edge and end distances are 1/2 inch.
- ³The minimum fastener spacing is 1 1/2 inches center-to-center, and minimum edge and end distances are 1/2 inch.
- ⁴The fasteners listed in the table above may be used for static load conditions and for the seismic load conditions described in Section 4.1.6 of this report, as applicable. The tabulated allowable loads apply to static load conditions; for seismic load conditions, the allowable loads must be limited in accordance with Section 4.1.6, Items 3 and 4, as applicable.
- ⁵Steel base material must have minimum yield and tensile strengths (F_y and F_u) equal to 36 ksi and 58 ksi, respectively, for A36 steel and equal to 50 ksi and 65 ksi, respectively, for A572 Grade 50 or A992 steel.

TABLE 8A—ALLOWABLE LOADS ON FASTENERS USED TO ATTACH WOOD SILL PLATES TO NORMALWEIGHT CONCRETE FOR STRUCTURAL WALLS^{1,2,3,6}

WASHERED PIN ASSEMBLY DESCRIPTION ⁷	FASTENER SHANK LENGTH (inches)	FASTENER SHANK DIAMETER (inch)	APPLICABLE SILL PLATE MATERIAL	WASHER THICKNESS (inch)	WASHER BEARING AREA (in ²)	ALLOWABLE LOAD (lbf)	
						Tension	Shear
0.300-inch Head Drive Pins with 7/8" Diameter Washer	3	0.145	See Note 4	0.075	0.557	125	150
0.300-inch Head Drive Pins with 1" Diameter Washer	3	0.145	See Note 4	0.075	0.770	125	150
0.300-inch Head Drive Pins with 1" Square Washer	3	0.145	See Note 4	0.055	1.147	125	150
0.300-inch Head MG Pins with 1" Diameter Washer	3	0.145	See Note 5	0.060	0.753	125	150
0.300-inch Head MG Pins with 1" Square Washer	3	0.145	See Note 5	0.060	1.164	125	150
8 mm Head Drive Pins with 1" Diameter Washer	27/8	0.145	See Note 4	0.075	0.770	125	150

For SI: 1 inch = 25.4 mm, 1 lbf = 4.48 N, 1 psi = 6.89 kPa.

MG = Mechanically Galvanized

- ¹The fasteners must not be driven until the concrete has reached a minimum compressive strength of 2,500 psi.
- ²Minimum fastener edge distance in concrete is 1 3/4 inches.
- ³Wood sill plate members connected to the substrate must be investigated for compliance with the applicable code in accordance with referenced design criteria, for both lateral resistance and fastener pull-through. See Section 4.1.5 of this report.
- ⁴Naturally durable lumber; see Section 3.4.5 of this report.
- ⁵Naturally durable lumber or preservative treated lumber. See Sections 3.1.1, 3.4.5, and 4.2.2 for applicable wood material and compatible fastener coatings.
- ⁶The fasteners listed in the table may be used to attach wood sill plates to concrete for structural walls in Seismic Design Categories A and B in accordance with Section 4.1.6, Item 5.

TABLE 8B—FASTENER SPACING REQUIREMENTS FOR WOOD SILL PLATE ANCHORAGE OF INTERIOR NONSTRUCTURAL WALLS^{1,2,3,4,5,6,7,8}

WASHERED PIN ASSEMBLY DESCRIPTION ⁸	FASTENER SHANK DIAMETER (inch)	FASTENER SHANK LENGTH (inches)	CONCRETE EDGE DISTANCE (inches)	MAXIMUM SPACING (feet)	MAXIMUM WALL HEIGHT (feet)
0.300-inch Head Drive Pins with 7/8" Diameter Washer 0.300-inch Head Drive Pins with 1" Diameter Washer 0.300-inch Head Drive Pins with 1" Square Washer 0.300-inch Head MG Pins with 1" Diameter Washer 0.300-inch Head MG Pins with 1" Square Washer	0.145	3	1 3/4	3	14
8 mm Head Drive Pin with 1" Diameter Washer	0.145	2 7/8	1 3/4	3	14

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm, 1 psi = 6.89 kPa.
MG = Mechanically Galvanized

- ¹Fasteners must not be driven until the concrete has reached a minimum concrete compressive strength of 2,500 psi.
- ²Interior nonstructural walls are limited to locations where bearing walls, shear walls or braced walls are not required by the approved plans.
- ³Fasteners must be driven into the center of the sill plate and be at least 1 3/4 inches from the concrete edge. Washer must bear on sill plate.
- ⁴Walls must have fasteners placed at 6 inches from ends of sill plates with maximum spacing between, as shown in this table.
- ⁵Walls must be laterally supported at the top and the bottom.
- ⁶Sill or bottom plates must comply with IBC Section 2304.1 and be of lumber with a specific gravity of 0.50 or greater. See Sections 3.1.1, 3.4.5 and 4.2.2 for applicable wood material and compatible fastener coatings.
- ⁷Minimum fastener spacing must be 4 inches center-to-center or must comply with Section 12.1.6 of the NDS (Section 11.1.5 for the 2012 IBC) to prevent splitting of the wood.
- ⁸The fasteners listed in the table may be used to attach wood sill plates to concrete for interior, nonstructural walls in Seismic Design Categories A through F in accordance with Section 4.1.6, Item 5.

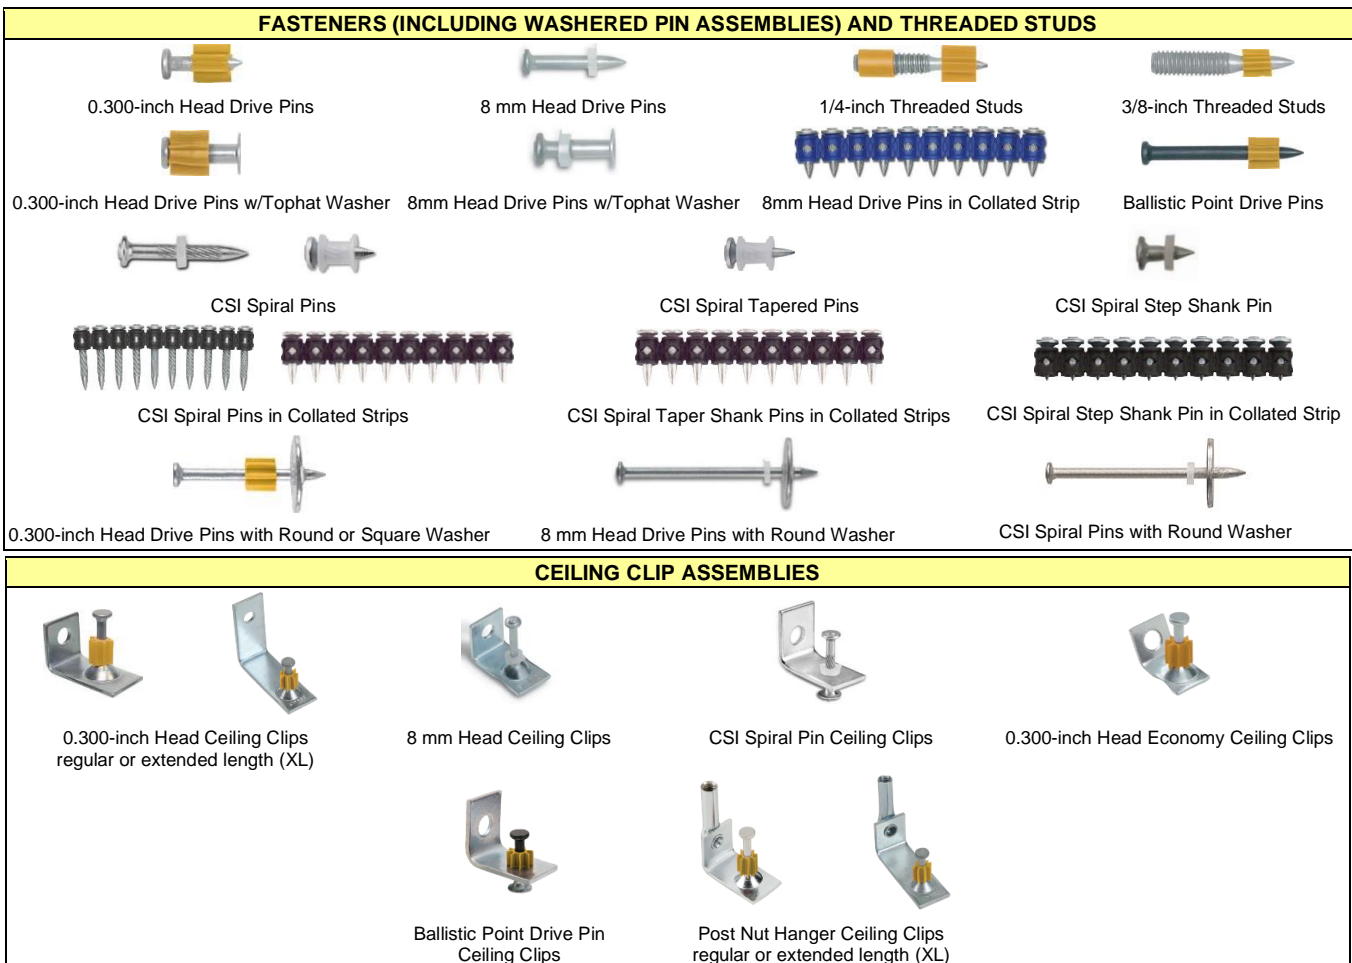

FIGURE 3—POWER-DRIVEN FASTENERS, THREADED STUDS AND CEILING CLIP ASSEMBLIES¹

¹Fasteners, threaded studs and assemblies illustrated with a premounted plastic guide washer and may be colored yellow, black or opaque (previously yellow guide washers were red in color). Plastic collations may be colored yellow, black, blue, or opaque.

REPORT HOLDER:

DEWALT

EVALUATION SUBJECT:**POWER-DRIVEN FASTENERS, CEILING CLIP ASSEMBLIES AND SILL PLATE ANCHORAGE (DEWALT)****1.0 REPORT PURPOSE AND SCOPE****Purpose:**

The purpose of this evaluation report supplement is to indicate that the power-driven fasteners, ceiling clip assemblies and sill plate anchorage, described in ICC-ES evaluation report ESR-2024, have also been evaluated for the codes noted below.

Applicable code editions:

- 2019 *California Building Code* (CBC)

For evaluation of applicable chapters adopted by the California Office of Statewide Health Planning and Development (OSHPD) AKA: California Department of Health Care Access and Information (HCAI) and the Division of the State Architect (DSA), see Sections 2.1.1 and 2.1.2 below.

- 2019 *California Residential Code* (CRC)

2.0 CONCLUSIONS**2.1 CBC:**

The power-driven fasteners, ceiling clip assemblies and sill plate anchorage, described in Sections 2.0 through 7.0 of evaluation report ESR-2024, comply with CBC Chapters 19, 22 and 23, provided the design and installation are in accordance with the 2018 *International Building Code*® (IBC) provisions noted in the evaluation report, and the additional design and inspection requirements of the CBC Chapters 16 and 17, as applicable.

2.1.1 OSHPD:

2.1.1.1 The power-driven fasteners, ceiling clip assemblies and sill plate anchorage, described in Sections 2.0 through 7.0 of the evaluation report ESR-2024, comply with the CBC amended Chapters 19 and 22 [OSHPD 1R, 2 & 5], Chapters 19A and 22A [OSHPD 1 & 4] and amended Chapter 23 [OSHPD 1, 1R, 2, 4 and 5], provided the design and installation are in accordance with the 2018 IBC provisions noted in the evaluation report and the additional requirements in Sections 2.1.1.1 and 2.1.1.2 of this supplement.

2.1.1.2 Verification Test Requirements: The installation verification test loads, frequency, and acceptance criteria shall be in accordance with Section 1901.3.4 [OSHPD 1R, 2 & 5] or 1910A.5 [OSHPD 1 & 4] of the CBC, as applicable.

2.1.1.3 Conditions of Use:

1. Use of power-actuated fastener in seismic shear applications shall be in accordance with Section 1901.3.1 [OSHPD 1R, 2 & 5] or Section 1617A.1.20 [OSHPD 1 & 4].
2. Sill plates under nonbearing interior partitions on concrete floor slabs shall be in accordance with Section 2304.3.4 of the CBC, Item 2, Second paragraph [OSHPD 1, 2 & 4].

2.1.2 DSA:

The power-driven fasteners, ceiling clip assemblies and sill plate anchorage, described in Sections 2.0 through 7.0 of evaluation report ESR-2024, comply with the CBC amended Chapters 19 and 22 [DSA-SS/CC], Chapters 19A and 22A [DSA-SS] and amended Chapter 23 [DSA-SS and DSA-SS/CC], provided the design and installation are in accordance with the 2018 IBC provisions noted in the evaluation report, and the additional requirements in Sections 2.1.2.1 and 2.1.2.2 of this supplement.

2.1.2.1 Verification Test Requirements: The installation verification test loads, frequency, and acceptance criteria shall be in accordance with Section 1909.2.7 [DSA-SS/CC] and 1910A.5 [DSA-SS] of the CBC, as applicable.

2.1.2.2 Conditions of Use:

1. Use of power-actuated fasteners in seismic shear applications shall be in accordance with Section 1617A.1.20 [DSA-SS].
2. Sill plates under nonbearing interior partitions on concrete floor slabs shall be in accordance with Section 2304.3.4 of the CBC, Item 2, Second paragraph [DSA-SS and DSA-SS/CC].

2.2 CRC:

The power-driven fasteners, ceiling clip assemblies and sill plate anchorage, described in Sections 2.0 through 7.0 of the evaluation report ESR-2024, comply with the CRC, provided the design and installation are in accordance with the 2018 *International Residential Code*[®] (IRC) provisions noted in the evaluation report.

This supplement expires concurrently with the evaluation report, reissued September 2023.

DEWALT

EVALUATION SUBJECT:

POWER-DRIVEN FASTENERS, CEILING CLIP ASSEMBLIES AND SILL PLATE ANCHORAGE (DEWALT)

1.0 REPORT PURPOSE AND SCOPE**Purpose:**

The purpose of this evaluation report supplement is to indicate that the DEWALT Power-driven Fasteners, Ceiling Clip Assemblies and Sill Plate Anchorage described in ICC-ES evaluation report ESR-2024, have also been evaluated for compliance with the codes noted below.

Applicable code editions:

- 2020 Florida Building Code—Building
- 2020 Florida Building Code—Residential

2.0 CONCLUSIONS

The DEWALT Power-driven Fasteners, Ceiling Clip Assemblies and Sill Plate Anchorage described in Sections 2.0 through 7.0 of evaluation report ESR-2024, comply with the *Florida Building Code—Building* and the *Florida Building Code—Residential*, provided the design and installation are in accordance with the 2018 *International Building Code*® provisions noted in the evaluation report.

Use of the DEWALT Power-driven Fasteners, Ceiling Clip Assemblies and Sill Plate Anchorage has also been found to be in compliance with the High-Velocity Hurricane Zone provisions of the *Florida Building Code—Building* and the *Florida Building Code—Residential* under the following conditions:

- DEWALT Power-driven Fasteners, Ceiling Clip Assemblies and Sill Plate Anchorage shall not be used in wood blocking attachment in accordance with the *Florida Building Code—Building* Section 2330.1.10.
- DEWALT Power-driven Fasteners, Ceiling Clip Assemblies and Sill Plate Anchorage have not been evaluated for use as cast-in-place anchors for compliance with High-Velocity Hurricane Zone Provisions and this use is outside the scope of this supplement.

For products falling under Florida Rule 61G20-3, verification that the report holder's quality assurance program is audited by a quality assurance entity approved by the Florida Building Commission for the type of inspections being conducted is the responsibility of an approved validation entity (or the code official when the report holder does not possess an approval by the Commission).

This supplement expires concurrently with the evaluation report, reissued September 2023.
