

ICC-ES Evaluation Report

ESR-5345

Reissued September 2024

Subject to renewal September 2025

ICC-ES Evaluation Reports are not to be construed as representing aesthetics or any other attributes not specifically addressed, nor are they to be construed as an endorsement of the subject of the report or a recommendation for its use. There is no warranty by ICC Evaluation Service, LLC, express or implied, as to any finding or other matter in this report, or as to any product covered by the report.

------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------	---------------------------------------------------------------	-------------------------------------------------------------------------------------

1.0 EVALUATION SCOPE

Compliance with the following codes:

- 2021, 2018, 2015 and 2012 [International Building Code® \(IBC\)](#).

Property evaluated:

- Structural

2.0 USES

The Pinnacle X10i framing members (studs and tracks) with a minimum G40 coating are used only as nonstructural members as defined by the North American Standard for Cold-Formed Steel Nonstructural Framing (AISI S220).

The Pinnacle X10i framing members (studs and tracks) with a minimum G60 coating are used as structural members as defined by the North American Standard for Cold-Formed Steel Structural Framing (AISI S240) and may also be used as nonstructural members.

3.0 DESCRIPTION

The designations and dimensions of studs and tracks are provided in [Table 1](#). [Figure 1](#) includes profiles of the studs and tracks.

The studs are manufactured with and without web punch-outs. When provided, the punch-outs have a width of 1 1/2 inches (38 mm) and a length of 4 inches (102 mm) in members with a depth of 3 1/2 inches (89 mm) or greater. The punch-outs are spaced a minimum of 24 inches (610 mm) on center and have a minimum distance between the end of the member and the near edge of the punch-out of 10 inches (254 mm).

The stud and track sections are cold-formed from steel coils conforming to ASTM A653 SS Grade 50 Class 1 or ASTM A1003 Structural Grade 50 Type H (ST50H) with a minimum G40 or G60 galvanized coating.

4.0 DESIGN AND INSTALLATION

4.1 Design:

The structural properties are provided in [Tables 2](#) and [3](#). The web crippling capacities for the studs are provided in [Table 4](#). These values have been determined in accordance with the North American Specification for the Design of Cold-Formed Steel Structural Members (AISI S100). However, additional design considerations per AISI S100 must be considered, such as the design of flexural members must address combined bending and web crippling, and combined bending and shear.

4.2 Installation:

The framing members must be installed in accordance with the applicable code, the approved plans and this report. If there is a conflict between the plans submitted for approval and this report, this report governs. The approved plans must be available at the jobsite at all times during installation.

5.0 CONDITIONS OF USE:

The framing members described in this report comply with, or are a suitable alternative to what is specified in, those codes listed in Section 1.0 of this report, subject to the following conditions:

- 5.1 Minimum uncoated base-metal thickness of the cold formed steel members as delivered to the jobsite must be at least 95 percent of the design base-metal thickness.
- 5.2 Complete plans and calculations verifying compliance with this report must be submitted to the code official for each project at the time of permit application. The calculations and drawings must be prepared and sealed by a registered design professional, where required by the statutes of the jurisdiction in which the project is to be constructed.
- 5.3 The framing members are manufactured under a quality control program with inspections by ICC-ES.

6.0 EVIDENCE SUBMITTED

Data in accordance with the [ICC-ES Acceptance Criteria for Cold-formed Steel Framing Members \(AC46\)](#), dated October 2019 (Editorially revised December 2020).

7.0 IDENTIFICATION

- 7.1 The ICC-ES mark of conformity, electronic labeling, or the evaluation report number (ICC-ES ESR-5345) along with the name, registered trademark, or registered logo of the report holder (Foundry Fabrication & Supply) must be included in the product label.
- 7.2 In additions, at a spacing not exceeding 96 inches (2440 mm) on center, each cold-formed steel member is stamped, stenciled or embossed with the company name or initials; the acronym "ICC-ES"; the evaluation report number (ESR-5345); the minimum uncoated base-metal thickness in mils or decimal inches; the minimum specified yield strength; in addition to the following:
 - For nonstructural members, each member must have the designation "NS".
 - For structural members, a designation for the coating (minimum G60).
- 7.3 The report holder's contact information is the following:

FOUNDRY FABRICATION & SUPPLY, LLC
POST OFFICE BOX 29495

chrisw@foundryfab.com

Definition of Symbols

Gross Properties (away from punch-outs)

I_{xx} = Moment of inertia about the x-axis.
 R_x = Strong axis radius of gyration.
 I_{yy} = Weak axis moment of inertia.
 R_y = Weak axis radius of gyration.

Torsional and Other Properties (away from punch-outs)

J = St. Venant torsion constant.
 C_w = Warping constant.
 X_o = Distance from shear center to neutral axis.
 R_o = Radii of gyration.
 β = Torsional flexural constant.
 L_u = Critical unbraced length for lateral-torsional buckling. Moments are considered fully braced when unbraced length is less than L_u .

Effective Properties (at section with punch-out, except for V_{ag}):

I_{xe} = Effective moment of inertia about the x-axis.
 S_{xe} = Effective section modulus about the x-axis.
 M_{a-L} = Allowable moment based on local buckling.
 M_{a-D} = Allowable moment based on distortional buckling.
 V_{ag} = Allowable strong axis shear away from punch-out.
 V_{aNet} = Allowable strong axis shear at the punch-out.

For SI Units: 1 inch = 25.4 mm, 1 mil = 0.001 inch

¹XXX = Overall depth in 100's of an inch. For example: 350 = 3.50 inches; 362 = 3.625 inches; and 1000 = 10.0 inches.

²For Tracks at location 2 (see [Figure 1](#)), there are no lips.

For SI Units: 1 lbf = 4.448 N, 1 kip = 4448 N, 1 inch = 25.4 mm, 1 lb/ft = 14.5939 N/m, 1 ft-lb = 1.3558 N-m

¹ Gross and torsional properties are based on the full-unreduced cross section of the studs, away from web punch-outs.

² Effective properties, except for V_{ag} , are based on studs with or without punchouts. Cold work of forming has not been considered.

³ Use the effective moment of inertia, I_{xe} , for deflection calculations.

⁴ M_{a-L} and M_{a-D} are based on the compression flange fully braced. For other conditions of compression flange bracing, the allowable moment must be determined in accordance with AISI S100.

⁵ M_{a-D} is calculated without the beneficial effect of sheathing to rotational stiffness. $K_o = 0$.

⁶ For definition of symbols, see page 2.

⁷ Web height-to-thickness ratio (h/t) exceeds 200 and is less than or equal to 260 per AISI S100. Web stiffeners are required at all support points and concentrated loads.

TABLE 3 – TRACK SECTION PROPERTIES AT LOCATION 2 ^{1,2,3,4,5}
